There's no such thing as a partial cure for needle sticks.

Discover the SAFSITE™ System for IS! therapy. No needles. No needle access. No needle sticks.

Needle sticks are a day-to-day threat in I.V. therapy. In spite of Universal Precautions, needle guards, even plastic needles, needle-stick accidents continue to happen.

Why? Because where there are steel needles, there is a risk. Partial cures can't protect you from accidents or someone else's carelessness.

Hold a SAFSITE™ valve in your hand, and you'll see why it means real needle-free safety in I.V. therapy.

The SAFSITE" valve attaches directly to your I.V. tubing, simply and safely replacing both injection caps and needles in IS! catheter access. You can administer medications, draw blood, connect piggyback lines, perform heparin locks or other intermittent procedures—all without needles.

The unique SAFSITE"" valve opens with any standard luer taper, from a syringe or I.V. set, and closes automatically when the taper is removed. Capped with a sterile dead-end cap, it can remain in place for up to 72 hours for needle-free I.V. administration*.

SAFSITE™ is easy to use-and compatible with standard I.V. tubing. The SAFSITE™ valve is available with or without a variety of extension sets and other needle-free components. See it for yourself!

To order your FREE Video and Sample Kit, mail the coupon below or call us toll-free at l-800-828-0793 today.

*In accordance with CDC guidelines, valves and tubing should be changed every 48 to 72 hours.
