immense cost? If "asbestos" is truly dangerous, however, can society afford *not* to repair a mistake? Before we charge forward like Don Quixote, we certainly ought to make sure that our analytical methodologies and the biological and sociological implications of the data are clearly understood. In this matter, haste will clearly lead to waste.

This book will definitely be useful to those scientists interested in the "asbestos" problem and what may become a "fibrous clay" problem. Its moderate price and paperback format make it a good buy. Aside from the concentrated typographical errors in certain parts of the volume, the text is generally well written, legible, and up to the usual M.S.A. standards. The figures are very clear, and the quality of printing is excellent.

MARTIN S. RUTSTEIN

REFEREES—VOLUME 29
Clays and Clay Minerals

The Clay Minerals Society is indebted to the following individuals who gave of their time and talents in acting as technical referees of manuscripts submitted for publication in Volume 29 of *Clays and Clay Minerals:*

Alietti, Andrea
Altschuler, Z. S.
Bailey, G. W.
Bailey, S. W.
