Dr. Clapham is also of opinion that his department has exemplified the greater readiness of such patients to be associated in treatment with other diseases rather than to attend as out-patients to an asylum or lunatic hospital. Those patients who will go to the latter are mostly cases who have been in-patients or are already qualified to become so.

That Dr. Clapham may soon be imitated in other large towns is a wish that will occur to everyone interested in the prevention of insanity.

REFERENCE

Journal of Mental Science, **XLIII**, April 1897, 328.

Researched by Henry Rollin, Emeritus Consultant Psychiatrist, Horton Hospital, Epsom, Surrey

Corrigendum

Seoane, A., Carrasco, G., Carbré, L., *et al*, *BJP*, 171, 340–345. In the description of the procedure of rapid detoxification in heroin addicts using clonidine (p. 341, second column, third paragraph), the dosage of clonidine used was printed incorrectly. The relevant sentence should read: "Every four hours 3 μg/kg clonidine was administered subcutaneously to attenuate adrenergic hyperactivity and 0.7 mg/kg metoclopramide was injected endovenously to increase gastric emptying."
