EARTH'S AMPHIBIOUS TRANSFORMATION

In the first history of the oceanic Anthropocene, Stefan Huebner explores the twentieth-century extension of human habitats into oceanic spaces. He shows how the effects of this amphibious transformation have followed a very different trajectory from human-driven change on land, in terms of both socioeconomic development and environmental degradation. The extension of the human habitat through artificial islands such as seabed-fixed and floating structures has granted vertical access to Earth's different spatial layers, from the fossil fuels beneath the seabed to outer space. Huebner asks why this transformation occurred; how it has been shaped by political, economic, and environmental factors; and how it has altered marine environments. A deeper understanding of Earth's amphibious transformation compels us to reconsider the history and future of climate change, sea level rise, energy transitions, human–marine species interactions, globalization, and even urbanization, including floating cities. This title is also available as Open Access on Cambridge Core.

STEFAN HUEBNER is Senior Research Fellow at the National University of Singapore, President of the Society of Floating Solutions (Singapore), and Deputy Chair of the International Scientific Committee of the World Conference on Floating Solutions.

Cambridge Oceanic Histories

Edited by
David Armitage
Renisa Mawani
Sujit Sivasundaram

Across the world, historians have taken an oceanic turn. New maritime histories offer fresh approaches to the study of global regions, and to long-distance and long-term connections. Cambridge Oceanic Histories includes studies across whole oceans (the Pacific, the Indian, the Atlantic) and particular seas (the Mediterranean, the Caribbean, the North Sea, the Black Sea, among others). The series is global in geography, ecumenical in historical method, and wide in temporal coverage, intended as a key repository for the most innovative transnational and world histories over the longue durée. It brings maritime history into productive conversation with other strands of historical research, including environmental history, legal history, intellectual history, labour history, cultural history, economic history and the history of science and technology. The editors invite studies that analyze the human and natural history of the world's oceans and seas from anywhere on the globe and from any and all historical periods.
